

Local anaesthetic- Lidocaine

- 1. Palpated the spermatic cord and isolate it by pulling it laterally. Using fingers keep the spermatic cord isolated until all the lidocaine is entered.**
- 2. Enter the needle into the spermatic cord at the level of the rudimentary teats, aspirate and observe for the absence of blood then administer 2 ml of Lidocaine.**
- 3. Pull back the needle slightly until it just exits the spermatic cord and administer 3 ml of Lidocaine into the subcutaneous tissue around the spermatic cord.**
- 4. Hold off and massage the Lidocaine into the tissue.**
- 5. Repeat this for the other spermatic cord.**
- 6. Thus, a total of 10 ml of Lidocaine is administered to the calf.**
